## Explosion Vent Sizing Worksheet

### General Information

Please fill in all the blanks in the below section. The information listed must be filled out in order for us to properly size your explosion vent.

Required Value	Value	Unit of Measure
<b>Process Media Name</b> The name of the chemical or substance enclosed in the system		
<b>Operation Pressure</b> The vessel's pressure during normal operation		
<b>Operation Temperature</b> The vessel's temperature during normal operation		
<b>Maximum Vacuum</b> The maximum pressure on the vent in the reverse direction of operation		
<b>Pstat</b> The desired burst pressure of the explosion vents. (1.5 psig for stock panels)		
<b>Pred</b> 2/3 of the maximum pressure the enclosure will withstand during a deflagration		
<b>Cycling</b> Is there pressure or temperature cycling? If so, how often and how much?		
<b>Vessel Volume</b> The total volume of the vessel exposed to the process media		
<b>Vessel L/D Ratio</b> Length / Diameter for circular enclosures or the equation to the right to determine D for non-circular enclosures		none
	$D = 2 \sqrt{\frac{Area}{3.14}}$	
<b>Vent Duct Length</b> The length of any ducting attached to the explosion vent outlet		

### Process Information

The above information must be filled out for any vent sizing. Once the General Information is filled out the appropriate section 1, 2, or 3 must also be completed.

**Section 1 : Dust or Hybrid mixed process media** This is for dust or hybrid mixture

**Section 2 : High strength enclosures (Gas/Mist Process Media)** This is for enclosures capable of withstanding pressures greater than 1.5 psi or 0.1 bar.

**Section 3 : Low strength enclosures (Gas/Mist Process Media)** This is for enclosures capable of withstanding pressures no greater than 1.5 psi or 0.1 bar.

## Section 1: Dust/Hybrid Process Media

Required Value	Value	Unit of Measure
<b>Kst (Deflagration Index)</b> Rate of pressure rise of the media during deflagration. See MSDS. External testing is sometimes required		bar-m/sec
<b>Percent Fill (Xr)</b> If known. Testing documentation from an organization having jurisdiction is required.		
<b>Qair</b> Flow rate of air through the equipment, usually in standard cubic feet/min		
<b>Pmax</b> The maximum pressure developed in an unvented vessel. See MSDS or test results		bar

## Section 2: High Strength Enclosure (Gas/Mist Process Media)

The is for enclosures capable of withstanding pressures greater than 1.5psi or 0.1bar

<b>Kg (Deflagration Index)</b> Rate of pressure rise of the media during deflagration. See MSDS. External testing is		bar-m/sec

## Section 3: Low Strength Enclosure (Gas/Mist Process Media)

The is for enclosures capable of withstanding pressures **no** greater than 1.5psi or 0.1bar

<b>Internal Surface Area</b> The total area of the vessel exposed to the process media		
<b>Fuel Constant</b> This can be located on the MSDS for the chemical		$\sqrt{p}$

**Key:**

Information needed for <b>all</b> applications to size to NFPA 68, 2007	ALL
Additional information required for <b>dust</b> sizing applications:	DUST
Additional information required for <b>high strength gas</b> enclosures:	HIGH STRENGTH GAS
Additional information required for <b>low strength gas</b> enclosures:	LOW STRENGTH GAS

**Additional Comments:**
